
$L = 10,\ g_i = 1.5 \to g_f = 0.5,\ K = 120\ (\alpha = 1),\ t = 0.8$
(a)
$2^L|\psi(s) - e^{i\theta}\phi(s)|^2$
$2^L|\psi(s)|^2$
(b)
fraction of error below
near-zero threshold
$2^L|\psi(s)|^2$
(c)
from previous step
from zero
from weighted fit of $\log\psi$
from single-time optimum
from single-time optimum
from tracked optimum
terms of tracked fit
terms of single-time fit
$1 - F$ after refit
tracked fit
largest-K truncation, unwrapped
